0.1 Setup

The follow packages will be used throughout this documents. R version 3.1.1 or higher is required to install all the packages using BiocInstaller::biocLite.

```
library("mzID")
library("MSnID")
library("MSnbase")
library("rpx")
library("MLInterfaces")
library("pRoloc")
library("pRolocdata")
library("MSGFplus")
library("modername the second to the secon
```

The most convenient way to install all the tutorials requirement (and more related content), is to install RforProteomics with all its dependencies.

```
library("BiocInstaller")
biocLite("RforProteomics", dependencies = TRUE)
```

Other packages of interest, such as rTANDEM or MSGFgui will be described later in the document but are not required to execute the code in this workflow.

0.2 Introduction

This workflow illustrates R / Bioconductor infrastructure for proteomics. Topics covered focus on support for open community-driven formats for raw data and identification results, packages for peptide-spectrum matching, data processing and analysis:

- Exploring available infrastructure
- Mass spectrometry data
- Getting data from proteomics repositories
- Handling raw MS data
- Handling identification data
- MS/MS database search
- Analysing search results
- High-level data interface
- Quantitative proteomics
- Importing third-party quantitation data
- Data processing and analysis
- Statistical analysis
- Machine learning
- Annotation
- Other relevant packages/pipelines

Links to other packages and references are also documented. In particular, the vignettes included in the RforProteomics package also contains relevant material.

0.3 Exploring available infrastructure

In Bioconductor version 3.2, there are respectively 71 proteomics, 51 mass spectrometry software packages and 11 mass spectrometry experiment packages. These respective packages can be extracted with the proteomicsPackages(), massSpectrometryPackages() and massSpectrometryDataPackages() and explored interactively.

```
library("RforProteomics")
pp <- proteomicsPackages()
display(pp)</pre>
```

0.4 Mass spectrometry data

Most community-driven formats are supported in R, as detailed in the table below.

Туре	Format	Package
raw	mzML, mzXML, netCDF, mzData	mzR (read)
identification	mzIdentML	<pre>mzR (read) and mzID (read)</pre>
quantitation	mzQuantML	
peak lists	mgf	MSnbase (read/write)
other	mzTab	MSnbase (read/write)

0.5 Getting data from proteomics repositories

MS-based proteomics data is disseminated through the ProteomeXchange infrastructure, which centrally coordinates submission, storage and dissemination through multiple data repositories, such as the PRIDE data base at the EBI for MS/MS experiments, PASSEL at the ISB for SRM data and the MassIVE resource. The rpx is an interface to ProteomeXchange and provides a basic access to PX data.

```
library("rpx")
pxannounced()
```

```
## 15 new ProteomeXchange annoucements

[1] "Gatto L, Christoforou A. Using R and Bioconductor for proteomics data analysis. Biochim Biophys Ac

Data files can then be downloaded with the pxget function. Below, we retrieve the sixth file, TMT_Erwinia_1uLSike_Top10HCD_isol2_4 20141210.mzML. The file is downloaded in the working directory and the name of the file is return by the function and stored in the mzf variable for later use.

```
mzf <- pxget(px, pxfiles(px)[6])
## Downloading 1 file
mzf
## [1] "TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01-20141210.mzML"</pre>
```

0.6 Handling raw MS data

[13] "highMZ"

[15] "precursorMZ"

[17] "precursorIntensity"

[19] "mergedResultScanNum"

[21] "mergedResultEndScanNum"

The mzR package provides an interface to the proteowizard C/C++ code base to access various raw data files, such as mzML, mzXML, netCDF, and mzData. The data is accessed on-disk, i.e it is not loaded entirely in memory by default but only when explicitly requested. The three main functions are openMSfile to create a file handle to a raw data file, header to extract metadata about the spectra contained in the file and peaks to extract one or multiple spectra of interest. Other functions such as instrumentInfo, or runInfo can be used to gather general information about a run.

Below, we access the raw data file downloaded in the previous section and open a file handle that will allow us to extract data and metadata of interest.

```
library("mzR")
ms <- openMSfile(mzf)</pre>
## Mass Spectrometry file handle.
## Filename: TMT_Erwinia_1uLSike_Top10HCD_iso12_45stepped_60min_01-20141210.mzML
## Number of scans: 7534
The header function returns the metadata of all available peaks:
hd <- header(ms)
dim(hd)
## [1] 7534
               21
names (hd)
##
    [1] "seqNum"
                                     "acquisitionNum"
##
    [3] "msLevel"
                                     "polarity"
##
   [5] "peaksCount"
                                     "totIonCurrent"
    [7] "retentionTime"
                                     "basePeakMZ"
   [9] "basePeakIntensity"
                                     "collisionEnergy"
##
## [11] "ionisationEnergy"
                                     "lowMZ"
```

"precursorScanNum"

"mergedResultStartScanNum"

"precursorCharge"

"mergedScan"

We can extract metadata and scan data for scan 1000 as follows:

```
hd[1000,]
##
        seqNum acquisitionNum msLevel polarity peaksCount totIonCurrent
## 1000
           1000
                           1000

                              400
                                         600
                                                     800
                                                                1000
                                                                                       1400
```

Below we reproduce the example from the MSmap function from the MSnbase package to plot a specific slice of the raw data using the mzR functions we have just described.

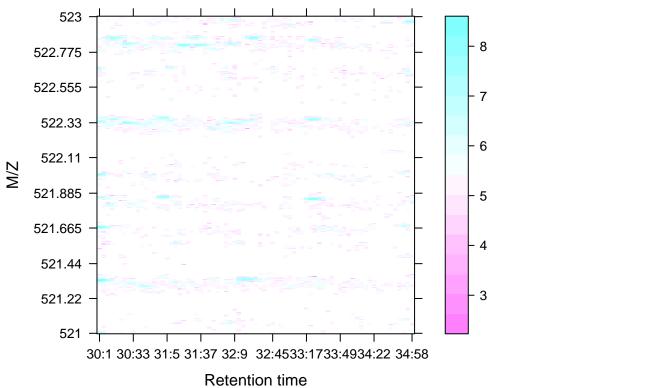

peaks(ms, 1000)[,1]

```
## a set of spectra of interest: MS1 spectra eluted
## between 30 and 35 minutes retention time
ms1 <- which(hd$msLevel == 1)
rtsel <- hd$retentionTime[ms1] / 60 > 30 &
    hd$retentionTime[ms1] / 60 < 35</pre>
```

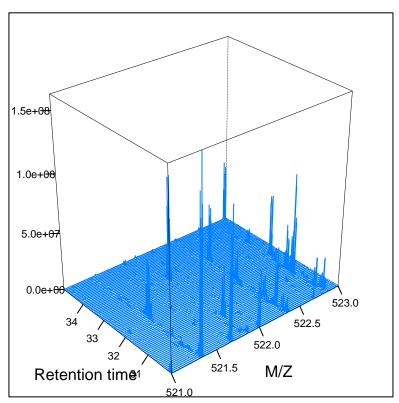

```
## the map
M <- MSmap(ms, ms1[rtsel], 521, 523, .005, hd)
```

1

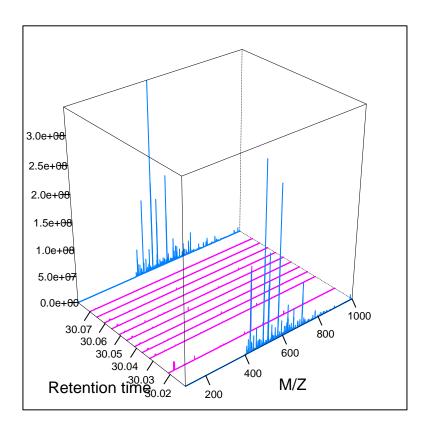

plot3D(M)

```
## With some MS2 spectra
i <- ms1[which(rtsel)][1]
j <- ms1[which(rtsel)][2]
M2 <- MSmap(ms, i:j, 100, 1000, 1, hd)</pre>
```

1

plot3D(M2)

0.7 Handling identification data

The RforProteomics package distributes a small identification result file (see ?TMT_Erwinia_1uLSike_Top10HCD_iso12_45stepped_that we load and parse using infrastructure from the mzID package.

```
library("mzID")
f <- dir(system.file("extdata", package = "RforProteomics"),</pre>
         pattern = "mzid", full.names=TRUE)
basename(f)
## [1] "TMT_Erwinia.mzid.gz"
id <- mzID(f)</pre>
## reading TMT_Erwinia.mzid.gz... DONE!
id
## An mzID object
##
## Software used:
                     MS-GF+ (version: Beta (v10072))
##
                     /home/lgatto/dev/00_github/RforProteomics/sandbox/TMT_Erwinia_1uLSike_Top10HCD_isol2_4
## Rawfile:
##
## Database:
                     /home/lgatto/dev/00\_github/RforProteomics/sandbox/erwinia\_carotovora.fasta
##
## Number of scans: 5287
## Number of PSM's: 5563
```

Various data can be extracted from the mzID object, using one the accessor functions such as database, scans, peptides, ... The object can also be converted into a data.frame using the flatten function.

The mzR package also provides support fast parsing mzIdentML files with the openIDfile function. As for raw data, the underlying C/C++ code comes from the proteowizard.

```
library("mzR")
f <- dir(system.file("extdata", package = "RforProteomics"),</pre>
         pattern = "mzid", full.names=TRUE)
id1 <- openIDfile(f)</pre>
fid1 <- mzR::psms(id1)</pre>
head(fid1)
##

0.8 MS/MS database search

While searches are generally performed using third-party software independently of R or can be started from R using a system call, the rTANDEM package allows one to execute such searches using the X!Tandem engine. The shinyTANDEM provides an experimental interactive interface to explore the search results.

```
library("rTANDEM")
?rtandem
library("shinyTANDEM")
?shinyTANDEM
```

Similarly, the MSGFplus package enables to perform a search using the MSGF+ engine, as illustrated below.

We search the TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01-20141210.mzML file against the fasta file from PXD000001 using MSGFplus.

We first download the fasta files:

```
fas <- pxget(px, pxfiles(px)[10])</pre>
## Downloading 1 file
basename(fas)
## [1] "erwinia_carotovora.fasta"
library("MSGFplus")
msgfpar <- msgfPar(database = fas,</pre>
                    instrument = 'HighRes',
                    tda = TRUE,
                    enzyme = 'Trypsin',
                   protocol = 'iTRAQ')
idres <- runMSGF(msgfpar, mzf, memory=1000)</pre>
## java -Xmx1000M -jar '/home/lg390/R/x86_64-unknown-linux-gnu-library/3.2/MSGFplus/MSGFPlus/MSGFPlus.jar'
##
## reading TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01-20141210.mzid... DONE!
idres
## An mzID object
##
                     MS-GF+ (version: Beta (v10072))
## Software used:
##
## Rawfile:
                     /home/lg390/Documents/Teaching/CSAMA_Brixen/Bressanone2015/CSAMA2015/materials/labs/5_
##
## Database:
                     /home/lg390/Documents/Teaching/CSAMA_Brixen/Bressanone2015/CSAMA2015/materials/labs/5_
##
## Number of scans: 5343
## Number of PSM's: 5656
## identification file (needed below)
basename(mzID::files(idres)$id)
```

[1] "TMT_Erwinia_1uLSike_Top10HCD_isol2_45stepped_60min_01-20141210.mzid"

(Note that in the runMSGF call above, I explicitly reduce the memory allocated to the java virtual machine to 3.5GB. In general, there is no need to specify this argument, unless you experience an error regarding the maximum heap size).

A graphical interface to perform the search the data and explore the results is also available:

```
library("MSGFgui")
MSGFgui()
```

0.9**Analysing search results**

The MSnID package can be used for post-search filtering of MS/MS identifications. One starts with the construction of an MSnID object that is populated with identification results that can be imported from a data.frame or from mzIdenML files.

```
library("MSnID")
msnid <- MSnID(".")
## Note, the anticipated/suggested columns in the
## peptide-to-spectrum matching results are:
```

#accessions: 3148 at 100 % FDR

```
## accession
## calculatedMassToCharge
## chargeState
## experimentalMassToCharge
## isDecoy
## peptide
## spectrumFile
## spectrumID
msnid <- read_mzIDs(msnid,</pre>
                    basename(mzID::files(idres)$id))
## Loaded cached data
show(msnid)
## MSnID object
## Working directory: "."
## #Spectrum Files: 1
## #PSMs: 5759 at 100 % FDR
## #peptides: 4942 at 99 % FDR
```

The package then enables to define, optimise and apply filtering based for example on missed cleavages, identification scores, precursor mass errors, etc. and assess PSM, peptide and protein FDR levels. Below, we start by apply a correction of monoisotopic peaks (see ?correct_peak_selection for details) and define two variables to be used for identification filtering.

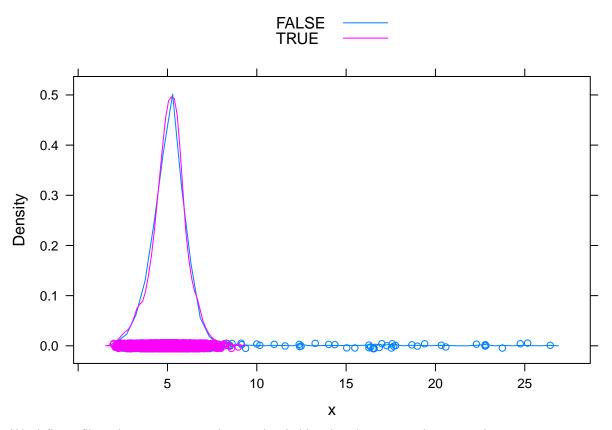

```
msnid <- correct_peak_selection(msnid)
msnid$msmsScore <- -log10(msnid$^MS-GF:SpecEValue`)
msnid$absParentMassErrorPPM <- abs(mass_measurement_error(msnid))</pre>
```

As shown below, this particular spiked-in data set displays few high scoring non-decoy hits

PSM

peptide

0 39 0 31

We define a filter object, assigning arbitrary threshold and evaluate it on the ${\tt msnid}$ data

```
filt0bj <- MSnIDFilter(msnid)</pre>
filtObj$absParentMassErrorPPM <- list(comparison="<", threshold=5.0)</pre>
filtObj$msmsScore <- list(comparison=">", threshold=8.0)
filt0bj
## MSnIDFilter object
## (absParentMassErrorPPM < 5) & (msmsScore > 8)
evaluate_filter(msnid, filt0bj)
##
                     fdr n
## PSM
              0.04545455 23
              0.06250000 17
## peptide
## accession 0.05882353 18
We can also optimise the filtering with a target protein FDR value of 0.01
filtObj.grid <- optimize_filter(filtObj, msnid, fdr.max=0.01,</pre>
                                  method="Grid", level="PSM",
                                  n.iter=50000)
filtObj.grid
## MSnIDFilter object
## (absParentMassErrorPPM < 12) & (msmsScore > 8.1)
evaluate_filter(msnid, filt0bj.grid)
##
              fdr n
```

```
## accession 0 26
We can now apply the filter to the data
msnid <- apply_filter(msnid, filt0bj.grid)
msnid

## MSnID object
## Working directory: "."
## #Spectrum Files: 1
## #PSMs: 39 at 0 % FDR
## #peptides: 31 at 0 % FDR
## #accessions: 26 at 0 % FDR</pre>
```

The resulting data can be exported to a data.frame or to a dedicated MSnSet data structure for quantitative MS data, described below, and further processed and analyses using appropriate statistical tests.

0.10 High-level data interface

The above sections introduced low-level interfaces to raw and identification results. The MSnbase package provides abstractions for raw data through the MSnExp class and containers for quantification data via the MSnSet class. Both store

- 1. the actual assay data (spectra or quantitation matrix, see below), accessed with spectra (or the [, [[operators) or exprs;
- 2. sample metadata, accessed as a data.frame with pData;
- 3. feature metadata, accessed as a data.frame with fData.

Another useful slot is processingData, accessed with processingData(.), that records all the processing that objects have undergone since their creation (see examples below).

The readMSData will parse the raw data, extract the MS2 spectra (by default) and construct an MS experiment object of class MSnExp.

```
## Object of class "MSnExp"
## Object size in memory: 0.2 Mb
## - - - Spectra data - - -
## MS level(s): 2
## Number of MS1 acquisitions: 1
## Number of MSn scans: 5
## A unique MZs
## Precursor MZ's: 437.8 - 716.34
## MSn M/Z range: 100 2016.66
## MSn retention times: 25:1 - 25:2 minutes
## - - Processing information - -
## Data loaded: Fri Jun 12 19:34:24 2015
```

Precursor: 546.9586

```
## MSnbase version: 1.17.5
## - - - Meta data - - -
## phenoData
##
    rowNames: 1
##
     varLabels: sampleNames
     varMetadata: labelDescription
##
## Loaded from:
##
     dummyiTRAQ.mzXML
## protocolData: none
## featureData
##
     featureNames: X1.1 X2.1 ... X5.1 (5 total)
##
     fvarLabels: spectrum
##
     fvarMetadata: labelDescription
## experimentData: use 'experimentData(object)'
MS2 spectra can be extracted as a list of Spectrum2 objects with the spectra accessor or as a subset of the original
MSnExp data with the [ operator. Individual spectra can be accessed with [[.
length(msexp)

0.11 Quantitative proteomics

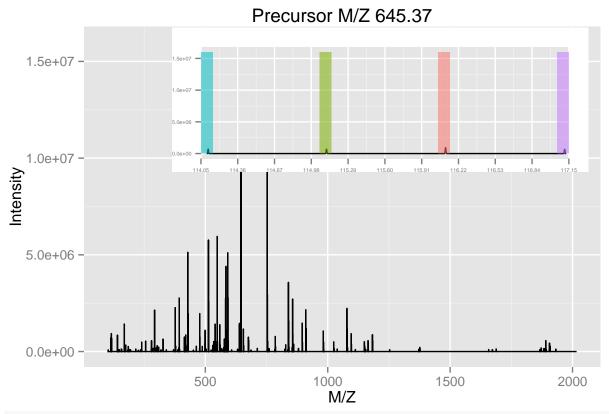

There are a wide range of proteomics quantitation techniques that can broadly be classified as labelled vs. label-free, depending whether the features are labelled prior the MS acquisition and the MS level at which quantitation is inferred, namely MS1 or MS2.

	Label-free	Labelled
MS1	XIC	SILAC, 15N
MS2	Counting	iTRAQ, TMT

In terms of raw data quantitation, most efforts have been devoted to MS2-level quantitation. Label-free XIC quantitation has however been addressed in the frame of metabolomics data processing by the xcms infrastructure.

An MSnExp is converted to an MSnSet by the quantitation method. Below, we use the iTRAQ 4-plex isobaric tagging strategy (defined by the iTRAQ4 parameter; other tags are available) and the trapezoidation method to calculate the area under the isobaric reporter peaks.

```
plot(msexp[[1]], full=TRUE, reporters = iTRAQ4)
```

msset <- quantify(msexp, method = "trap", reporters = iTRAQ4, verbose=FALSE)
exprs(msset)</pre>

```

MSnbase version: 1.17.5

Other MS2 quantitation methods available in quantify include the (normalised) spectral index SI and (normalised) spectral abundance factor SAF or simply a simple count method.

Note that spectra that have not been assigned any peptide (NA) or that match non-unique peptides (npsm > 1) are discarded in the counting process.

See also The <u>isobar</u> package supports quantitation from centroided mgf peak lists or its own tab-separated files that can be generated from Mascot and Phenyx vendor files.

0.12 Importing third-party quantitation data

The PSI mzTab file format is aimed at providing a simpler (than XML formats) and more accessible file format to the wider community. It is composed of a key-value metadata section and peptide/protein/small molecule tabular sections.

```
mztf <- pxget(px, pxfiles(px)[2])</pre>
## Downloading 1 file
(mzt <- readMzTabData(mztf, what = "PEP"))</pre>
## Warning in readMzTabData(mztf, what = "PEP"): Support for mzTab version 0.9
## only. Support will be added soon.
## Detected a metadata section
## Detected a peptide section
## MSnSet (storageMode: lockedEnvironment)
## assayData: 1528 features, 6 samples
     element names: exprs
## protocolData: none
## phenoData
##
     rowNames: sub[1] sub[2] ... sub[6] (6 total)
##
     varLabels: abundance
##
     varMetadata: labelDescription
## featureData
##
     featureNames: 1 2 ... 1528 (1528 total)
     fvarLabels: sequence accession ... uri (14 total)
##
     fvarMetadata: labelDescription
## experimentData: use 'experimentData(object)'
```

It is also possible to import arbitrary spreadsheets as MSnSet objects into R with the readMSnSet2 function. The main 2 arguments of the function are (1) a text-based spreadsheet and (2) column names of indices that identify the quantitation data. The latter can be queried with the getEcols function.

```
csv <- dir(system.file ("extdata" , package = "pRolocdata"),</pre>
           full.names = TRUE, pattern = "pr800866n_si_004-rep1.csv")
getEcols(csv, split = ",")

```

0.13 Data processing and analysis

0.13.1 Raw data processing

For raw data processing look at MSnbase's clean, smooth, pickPeaks, removePeaks and trimMz for MSnExp and spectra processing methods.

The MALDIquant and xcms packages also features a wide range of raw data processing methods on their own ad hoc data instance types.

0.13.2 Processing and normalisation

Each different types of quantitative data will require their own pre-processing and normalisation steps. Both isobar and MSnbase allow to correct for isobaric tag impurities normalise the quantitative data.

```
data(itraqdata)
qnt <- quantify(itraqdata, method = "trap",</pre>
                  reporters = iTRAQ4, verbose = FALSE)
impurities \leftarrow matrix(c(0.929,0.059,0.002,0.000,
                         0.020,0.923,0.056,0.001,
                         0.000,0.030,0.924,0.045,
                         0.000, 0.001, 0.040, 0.923),
                       nrow=4, byrow = TRUE)
## or, using makeImpuritiesMatrix()
## impurities <- makeImpuritiesMatrix(4)</pre>
qnt.crct <- purityCorrect(qnt, impurities)</pre>
processingData(qnt.crct)
## - - - Processing information - - -
## Data loaded: Wed May 11 18:54:39 2011
## iTRAQ4 quantification by trapezoidation: Fri Jun 12 19:34:34 2015
## Purity corrected: Fri Jun 12 19:34:34 2015
## MSnbase version: 1.1.22
Various normalisation methods can be applied the MSnSet instances using the normalise method: variance stabilisation
(vsn), quantile (quantiles), median or mean centring (center.media or center.mean), ...
qnt.crct.nrm <- normalise(qnt.crct, "quantiles")</pre>
The combineFeatures method combines spectra/peptides quantitation values into protein data. The grouping is defined
by the groupBy parameter, which is generally taken from the feature metadata (protein accessions, for example).
```

```
## Normalised (quantiles): Fri Jun 12 19:34:34 2015
## Combined 55 features into 3 using sum: Fri Jun 12 19:34:34 2015
## MSnbase version: 1.1.22
```

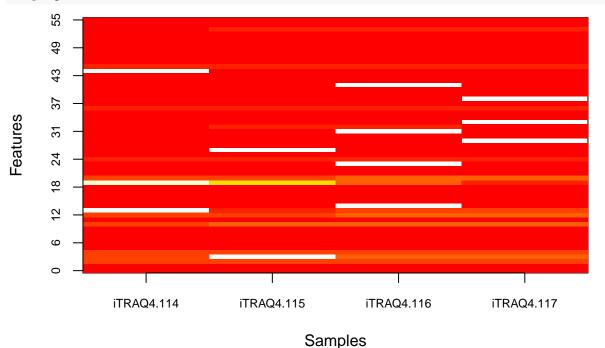

Finally, proteomics data analysis is generally hampered by missing values. Missing data imputation is a sensitive operation whose success will be guided by many factors, such as degree and (non-)random nature of the missingness.

Below, missing values are randomly assigned to our test data and visualised on a heatmap.

```
set.seed(1)
qnt0 <- qnt
exprs(qnt0)[sample(prod(dim(qnt0)), 10)] <- NA
table(is.na(qnt0))</pre>
```

```
##
## FALSE TRUE
## 209 11
```

image(qnt0)

Missing value in MSnSet instances can be filtered out and imputed using the filterNA and impute functions.

```
## remove features with missing values
qnt00 <- filterNA(qnt0)
dim(qnt00)</pre>
```

```
## [1] 44 4
any(is.na(qnt00))

## [1] FALSE

## impute missing values using knn imputation
qnt.imp <- impute(qnt0, method = "knn")
dim(qnt.imp)</pre>
```

```
## [1] 55 4
```

```
any(is.na(qnt.imp))
```

[1] FALSE

There are various methods to perform data imputation, as described in ?impute.

0.14 Statistical analysis

R in general and Bioconductor in particular are well suited for the statistical analysis of data. Several packages provide dedicated resources for proteomics data:

- MSstats: A set of tools for statistical relative protein significance analysis in DDA, SRM and DIA experiments. Data stored in data.frame or MSnSet objects can be used as input.
- msmsTest: Statistical tests for label-free LC-MS/MS data by spectral counts, to discover differentially expressed proteins between two biological conditions. Three tests are available: Poisson GLM regression, quasi-likelihood GLM regression, and the negative binomial of the edgeR package. All can be readily applied on MSnSet instances produced, for example by MSnID.
- isobar also provides dedicated infrastructure for the statistical analysis of isobaric data.

n## Machine learning

The MLInterfaces package provides a unified interface to a wide range of machine learning algorithms. Initially developed for microarray and ExpressionSet instances, the pRoloc package enables application of these algorithms to MSnSet data.

0.14.1 Classification

The example below uses knn with the 5 closest neighbours as an illustration to classify proteins of unknown sub-cellular localisation to one of 9 possible organelles.

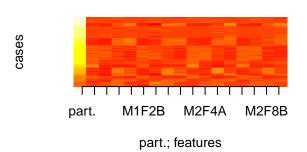

```
library("MLInterfaces")
library("pRoloc")
library("pRolocdata")
data(dunkley2006)
traininds <- which(fData(dunkley2006)$markers != "unknown")</pre>
ans <- MLearn(markers ~ ., data = t(dunkley2006), knnI(k = 5), traininds)
ans
## MLInterfaces classification output container
## The call was:
## MLearn(formula = markers ~ ., data = t(dunkley2006), .method = knnI(k = 5),
##
       trainInd = traininds)
## Predicted outcome distribution for test set:
##
##
        ER lumen
                   ER membrane
                                        Golgi Mitochondrion
                                                                   Plastid
##
               5
                            140
                                           67
                                                          51
                                                                        29
              PM
                                          TGN
                                                    vacuole

    55
        28
            29
                18
                    60
                        30
                            44 145
                                    78 116
                                                 53
## The call that created this object was:
## MLearn(formula = ~., data = dunkley2006, .method = kmeansI, centers = 12)
plot(kcl, exprs(dunkley2006))
```

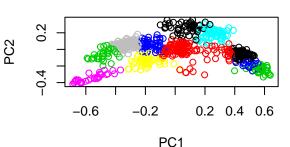

Average silhouette width: 0.31

PCA screeplot

PCA colored by partition

A wide range of classification and clustering algorithms are also available, as described in the ?MLearn documentation page. The pRoloc package also uses MSnSet instances as input and ,while being conceived with the analysis of spatial/organelle proteomics data in mind, is applicable many use cases.

0.15 Annotation

All the Bioconductor annotation infrastructure, such as biomaRt, GO.db, organism specific annotations, .. are directly relevant to the analysis of proteomics data. A total of 93 ontologies, including some proteomics-centred annotations such as the PSI Mass Spectrometry Ontology, Molecular Interaction (PSI MI 2.5) or Protein Modifications are available through the rols.

```
library("rols")
olsQuery("ESI", "MS")
```

MS:1000073 MS:1000162

```
## "ESI" "HiRes ESI"
```

Data from the Human Protein Atlas is available via the hpar package.

0.16 Other relevant packages/pipelines

- Analysis of post translational modification with isobar.
- Analysis of label-free data from a Synapt G2 (including ion mobility) with synapter.
- Analysis of spatial proteomics data with pRoloc.
- Analysis of MALDI data with the MALDIquant package.
- Access to the Proteomics Standard Initiative Common QUery InterfaCe with the PSICQUIC package.

Additional relevant packages are described in the RforProteomics vignettes.
